# More Than Metrics

Frontend test task

Building a prototype for a Smaply feature.

Design and mock API

- All specifications for the design can be found in the mockup at Invision.
- Font: Source Sans Pro https://fonts.google.com/specimen/Source+Sans+Pro
- Icons: FontAwesome. Just use the free version. If the exact icons can not be found, just use similar icons. https://fontawesome.com
- API blueprint: https://smaplypersonastest.docs.apiary.io

Questions

Any questions regarding the task could be asked to jesse@morethanmetrics.com

Requirements

- Use the API blueprint at Apiary to retrieve data (GET).
- The outgoing requests you don't have to implement, just output the requests in the console for us to see them (POST/PUT/PATCH/DELETE).
- Show the name of the persona in the header (header = second horizontal bar from the top, with light background).
- Make the name of the persona editable in the header.
- The other buttons in the header don't have to be editable.
- The menu + header should stay in the same place when scrolling.
- The sidebar should have 100% of the available height (exactly as in the design).
- The sidebar should stay in place when scrolling the page.
- The close-button of the sidebar does not have to work.
- The elements for the persona (Short text, long text, image etc.) should be draggable into the persona-template on the right.
- Only having the 'Short text' draggable would be enough.
- The information of the Persona should be pulled from the API blueprint at Apiary.
- Make the persona name editable in the persona-template itself. When the name changes, update the initials as well right away ("initials" = first 3 letters of persona name in uppercase).
- The initials should be editable as well, overwriting the pre-existing initials.
- The name of the persona can not be left empty; an visual queue for leaving the persona name empty should be added in that case: make the background of the textfield red.
- The changed data should be saved automatically after input (output the update requests in the console).
- Add ability to drag the fields of the persona within the left- and right-column in the persona-template.
- After dragging fields into a different location; output the update-request in the console (mind the correct order of the fields).
- Replace the cog-icon with a trash-bin icon and implement deleting a field (+ output the update-request in the console).
- Any text added to text-fields should be updated on blur.

Sharing your prototype

- Publish your prototype as a demo-page somewhere accessible for us.
- Publish the code on a platform of choice for us to review (Github, Bitbucket etc.)
